Occupancy distributions depend on the coordinate frame
$\phi = 0$
$\phi = \pi/2$
$\phi = \pi$
$\phi = 3\pi/2$
$\phi = 2\pi$
Laboratory coordinates
Probability mass per bin
Optimized p_2
Control h_2
$N(g)$
Static coordinates
Probability mass per bin
Optimized p_2
Control h_2
Static prediction
$N(U_G^\dagger g)$
Only the distributions transformed back to static coordinates are compared with the cat family.
